

Lake Victoria's fish parasites: a story of ecosystem transformation

Joint Parasitology Spring Meeting
Würzburg, 11-14 March 2025

Parasites & Ecosystems

Wildlife parasites are fascinating and... important for ecosystems!

Substantial part of the biomass

Kuris et al., 2008

Parasites & Ecosystems

Wildlife parasites are fascinating and... important for ecosystems!

Substantial part of the biomass

Provide many ecosystem services:

- Increasing biodiversity
- Regulating of host populations
- Reducing impact of toxic pollutants

Sures & Siddal, 2003

Parasites & Ecosystems

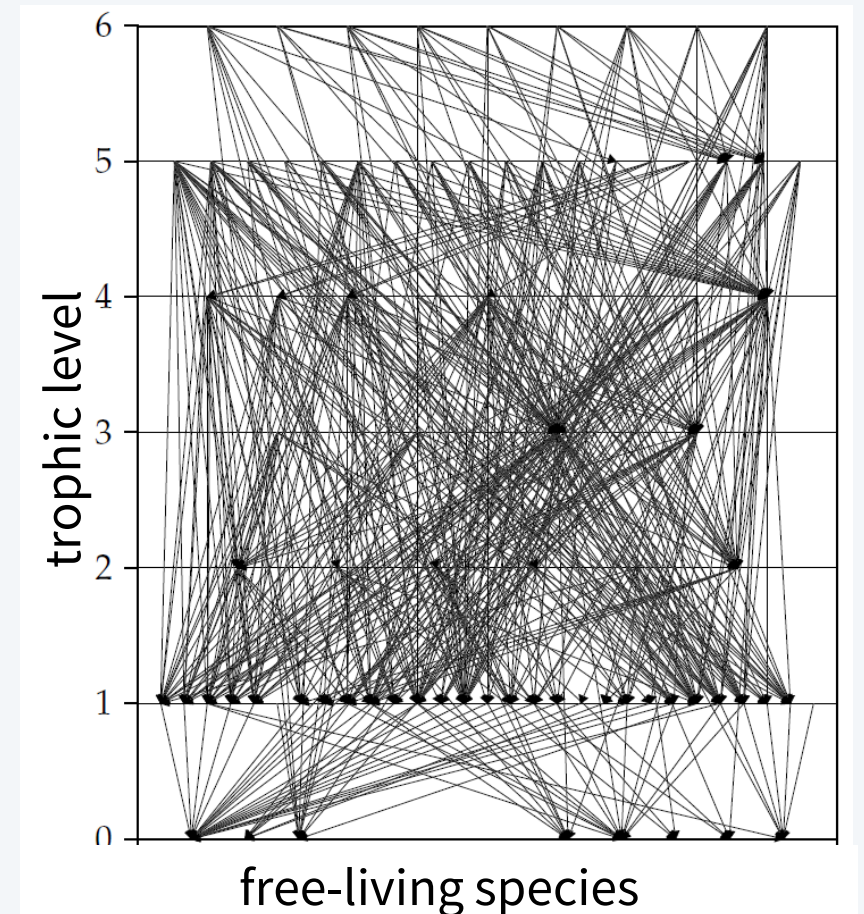

Wildlife parasites are fascinating and... important for ecosystems!

Lafferty et al., 2006

Substantial part of the biomass

Provide many ecosystem services:

- Increasing biodiversity
- Regulating of host populations
- Reducing impact of toxic pollutants
- Linking food webs
(75% of the links)

Parasites & Ecosystems

Wildlife parasites are fascinating and... important for ecosystems!

Lafferty et al., 2006

Substantial part of the biomass

Provide many ecosystem services:

- Increasing biodiversity
- Regulating of host populations
- Reducing impact of toxic pollutants
- Linking food webs
(75% of the links)

Parasites & Ecosystems

Wildlife parasites are fascinating and... important for ecosystems!

Substantial part of the biomass

Provide many ecosystem services:

- Increasing biodiversity
- Regulating of host populations
- Reducing impact of toxic pollutants
- Linking food webs
(75% of the links)

**Wildlife parasites
contribute to ecosystem
robustness and resilience**

Parasites & Ecosystems

What can we learn from wildlife parasites?

- **Status of ecosystem health**

An ecosystem rich in parasites is a healthy ecosystem

- **Link between habitat degradation and spillovers**

If an ecosystem changes, then host-parasite interactions change too

Not only human-nature direct contact, but also human activities

(main predictor of spillovers: change in land use)

One Health

“us versus them”

Animals as potential threat

rabies risk from raccoons,
wildlife reservoirs of pathogens

Barrier approach

quarantine, avoidance behaviours,
vector/reservoir population control

One Health

“us versus them”

Animals as
potential threat

rabies risk from raccoons,
wildlife reservoirs of pathogens

Barrier approach

quarantine, avoidance behaviours,
vector/reservoir population control

change in
perspective

“shared risk”

Animals as
sentinels **including wildlife
parasites!**

Dancing cats provided early warning
on methyl-mercury pollution

Human–animal–environment
disease relationships

Parasites & Ecosystems

This is particularly relevant in the context of global change:

How global change affects parasites?

- Are wildlife parasites declining?
- If so, can we mitigate this?

Lake Victoria

Lake Victoria

- African Great Lake (~60'000 km²)
- Well studied system (especially fishes)
- Good model for anthropogenic impact on wetlands:

human perturbations
since 1980s

Lake Victoria

Anthropogenic changes

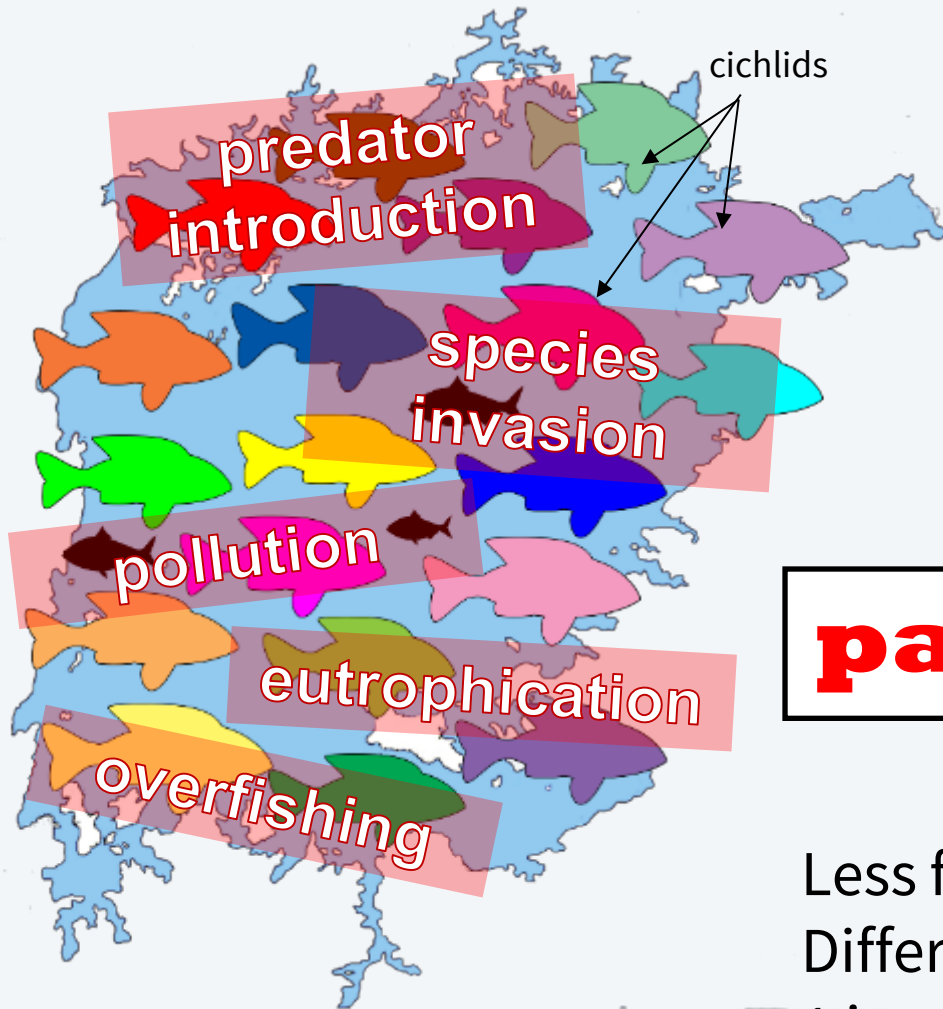

- Water eutrophication
- Species invasions
- Overfishing
- Pollution

Nile perch
(*Lates niloticus*)

Lake Victoria

parasites?

Less fish species
Different fish community
1 invasive predator

Lake Victoria: Study design

Before-after impact study,
using historical and recent
collections

13 cichlid fish species
screened for gill
macroparasites

1 host individual = 1 parasite community

Lake Victoria: Gill parasites

*Lamproglana
monodi*

*Ergasilus
lamellifer*

copepods
(crustaceans)

*Lamproglana
monodi*

Lake Victoria: Gill parasites

Lamproglana monodi

Ergasilus lamellifer

copepods
(crustaceans)

C. nyanza

C. pseudodossoui

C. furu

C. vetusmolendarius

C. longipenis

C. bifurcatus

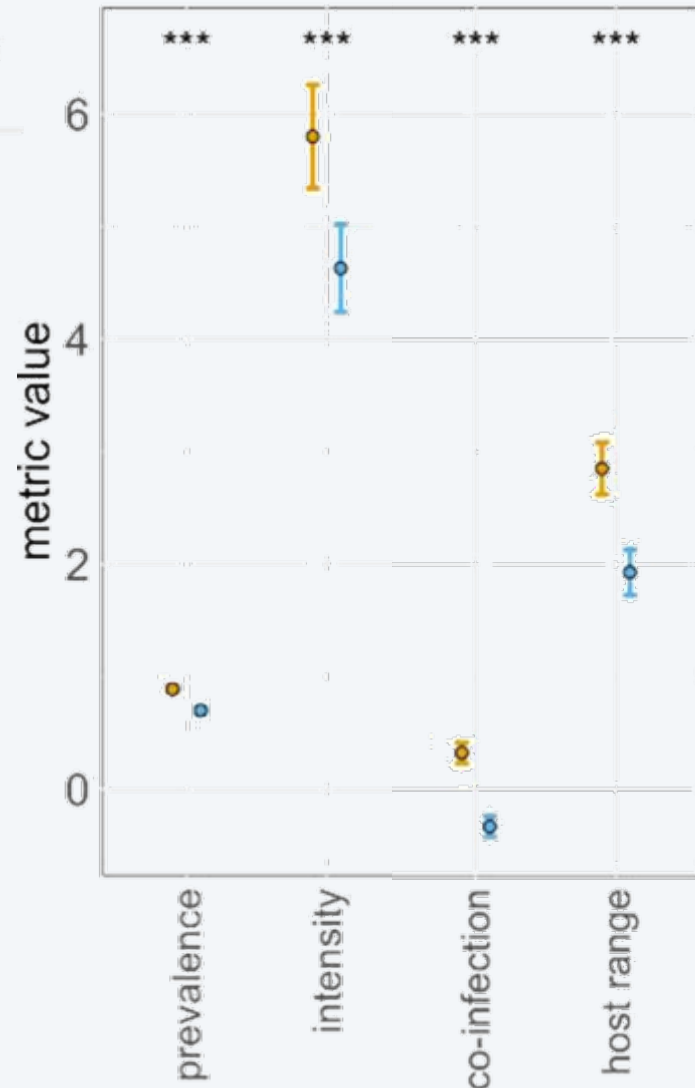

Gyrodactylus sturmbaueri

Cichlidogyrus

monopisthocotylans
(flatworms)

Lake Victoria: temporal changes

After ecosystem perturbations in Lake Victoria:

- **Fewer** fish were infected
(prevalence decreased)
- Fish were infected by a **lower** number of parasites
(intensity decreased)
- Co-infections became **less** frequent
(decreased occurrence of ≥ 2 parasite species on the same host individual)
- Parasite species infected **less** host species
(host range decreased)
- Parasite species infected **different** host species
(result not shown here)

Disentangling the causes

Are these changes in parasite infections really due to human perturbations?

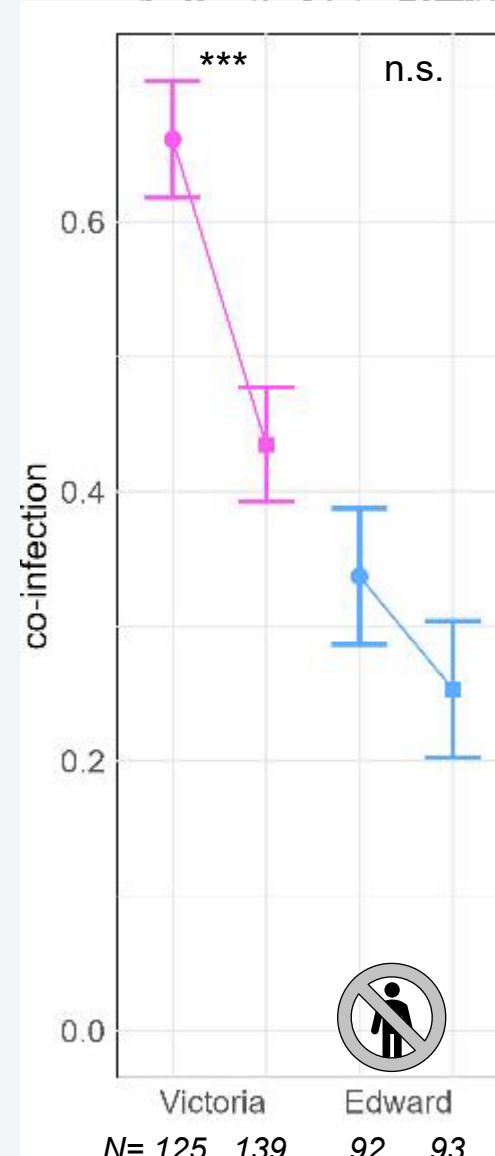

Lake Edward

- (almost) pristine ecosystem
- Close to Victoria
- Harboured cichlids from the LVictoria radiation superflock

→ Test for temporal changes in parasitism in Lake Edward

Disentangling the causes

Lake Edward:
unchanged
→ changes in
parasitism in
Lake Victoria
are due to
human
perturbations,
rather than to
natural
fluctuations

Disentangling the causes

What are the causes of the changes in parasitism in Lake Victoria?

Lake Albert

- Naturally high predation

Lake George

- Naturally eutrophic
- Close to Victoria
- Harboured cichlids from the LVictoria radiation superflock

→ space-for-time approach

Lake Victoria: Conclusions

- Parasites intensity, prevalence, and co-infections decreased after perturbations in Lake Victoria
- Ecosystem perturbations can favor spillovers: parasites infected fewer and different host species

Parasites as sentinels:

- to provide an early warning for host switches
- to monitor ecosystem health

→ **Need to monitor changes in abundance:**

Are wildlife parasites threatened by extinction?

Conservation of wildlife parasites

Extinction of wildlife parasite species is not good news!

Wildlife parasites

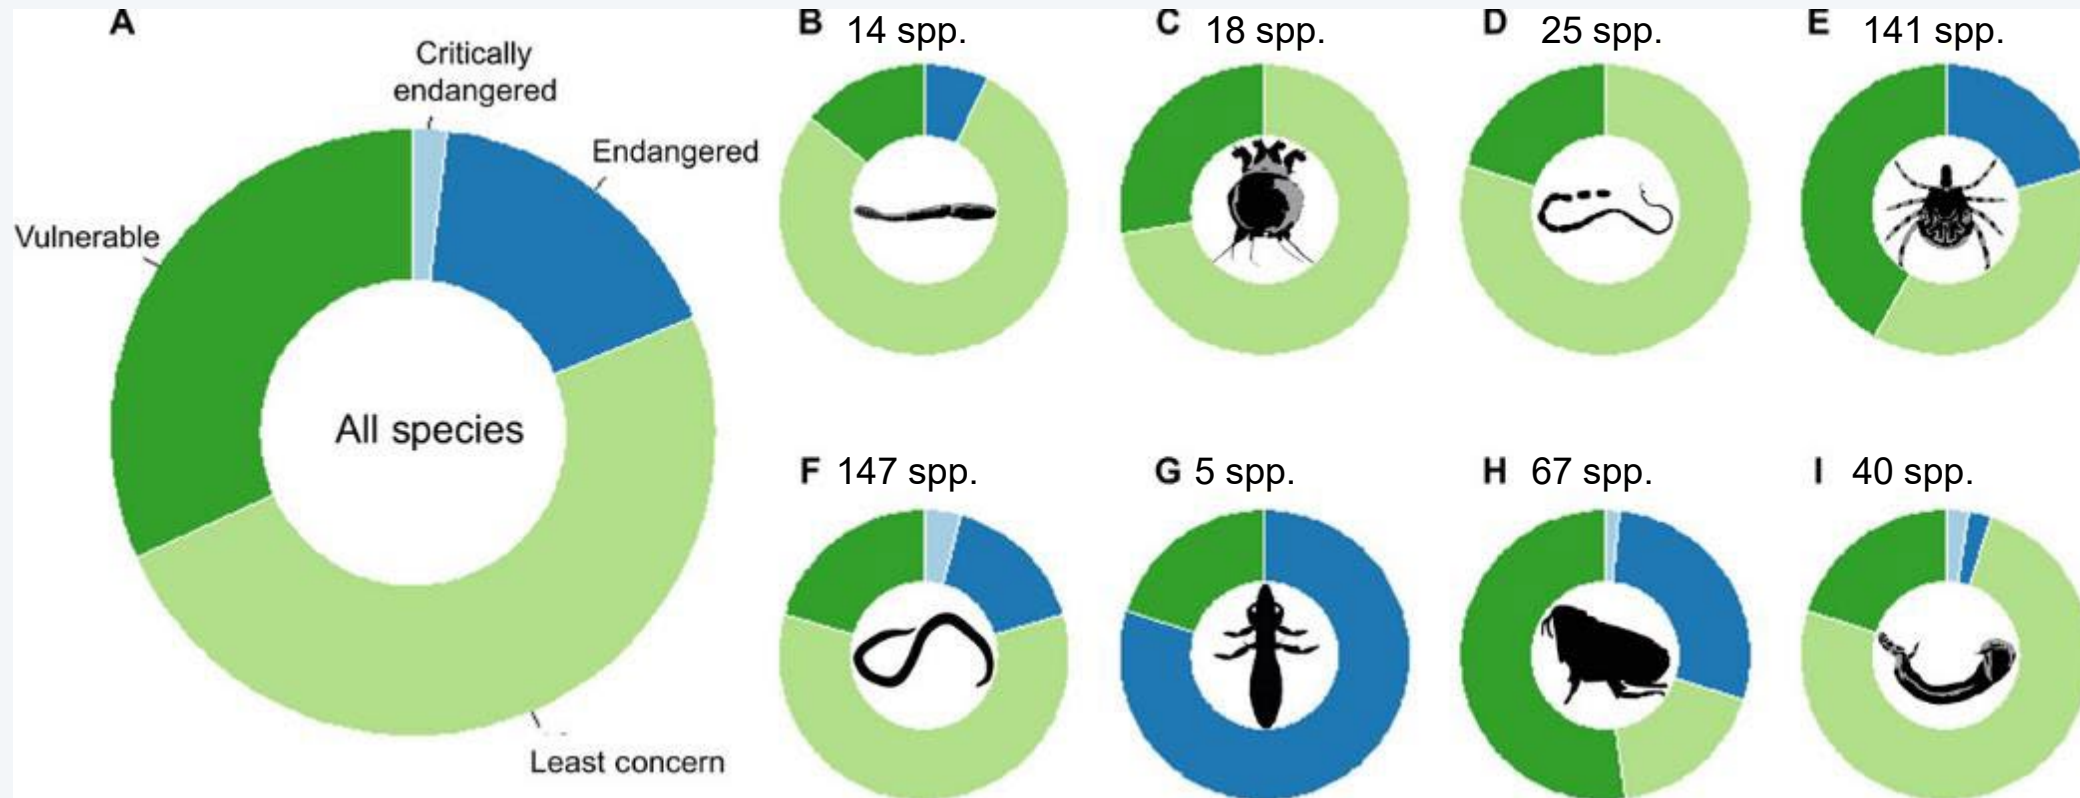

- Provide many ecosystem services
 - regulating host populations
 - linking food webs
 - reducing impact of toxic pollutants
 - contributing to biodiversity
- Have an intrinsic value
 - are part of genetic and species diversity
 - represent a (large) portion of evolutionary history

Conservation of wildlife parasites

Wildlife parasites are probably more endangered than their hosts

Carlson et al., 2017

Estimations based on habitat loss

Conservation of wildlife parasites

IUCN = International Union for Conservation of Nature

IUCN Parasite Specialist Group

Red List to assess conservation status of species
(parasites are across many taxon groups)

Raise awareness, contribute to action plans

Wildlife parasites:
**Excluding parasites of humans
and of domestic animals !**

Conservation

Commonly, (species-specific) parasites are intentionally removed during conservation actions targeting their hosts

Gophertortoise tick
(*Amblyomma tuberculatum*)

Gopher tortoise
(*Gopherus polyphemus*)

Amblyomma personatum
Dermacentor rhinocerinus

Black rhinoceros
(*Diceros bicornis*)

California condor louse
(*Colpocephalum californici*)

Californian condor
(*Gymnogyps californianus*)

→ increases the extinction risk of parasites
→ conservation-induced extinction

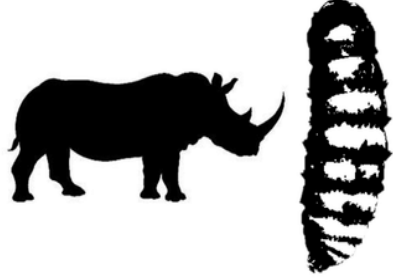

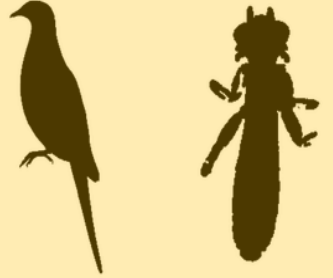

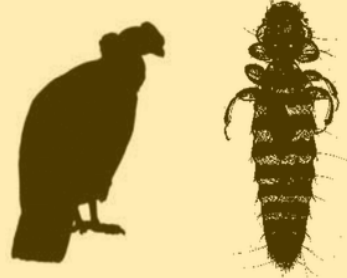

Dilemma of conserving parasites

Protect endangered free-living species at the risk of causing parasite decline/extinction?

OR

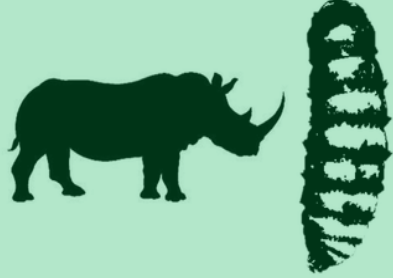

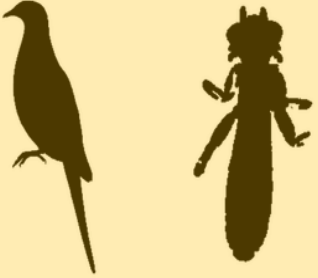

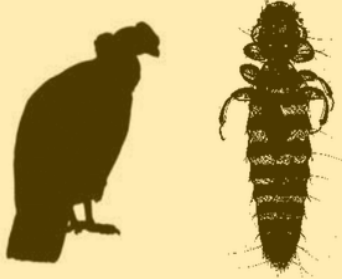

Protect endangered parasite species at the risk of decreasing host fitness?

	Host conserved	Host extinct
Parasite conserved	 <p>Ideal circumstances: both are saved</p> <p>Charismatic megafauna with vital highly-specific parasites</p>	 <p>Reintroduction into alternative hosts OR Rediscovery after host extinction</p>
Parasite extinct	 <p>Current conservation paradigm</p> <p>Parasite a human health risk or otherwise unsuitable candidate</p>	 <p>Current paradigm when host conservation proves unsuccessful</p>

Dilemma of conserving parasites

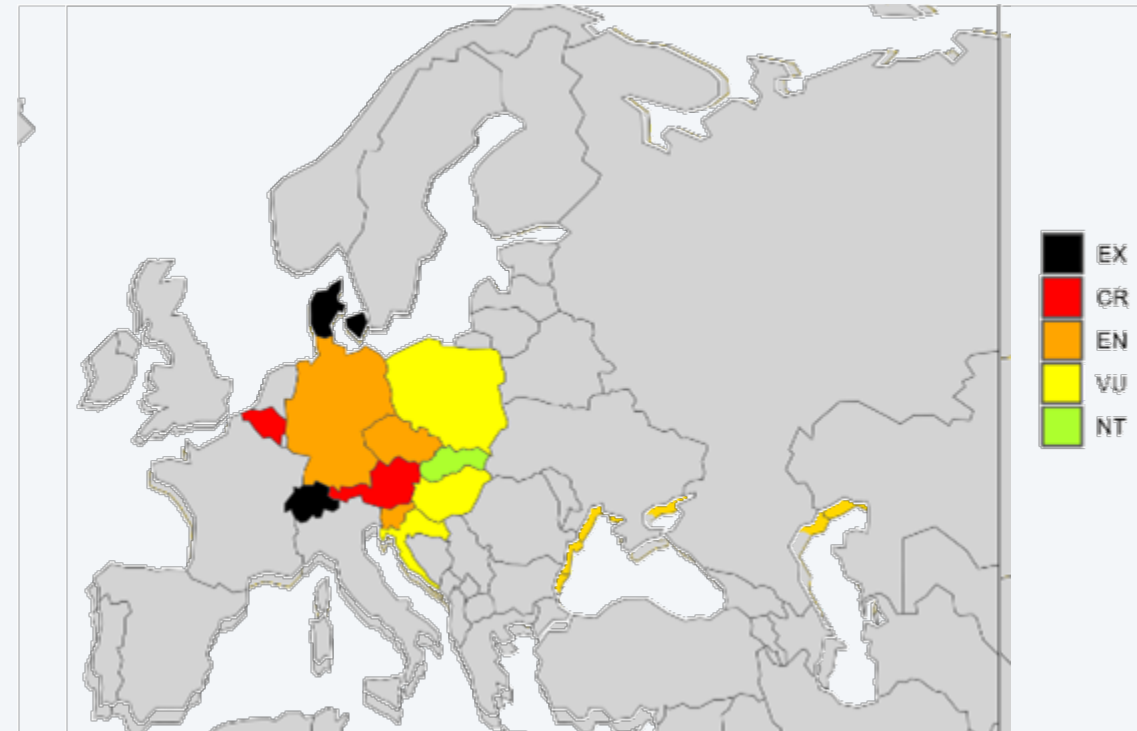

Conservation of one species
should NOT hamper
the conservation of other species!

	Host conserved	Host extinct
Parasite conserved	 <p>Ideal circumstances: both are saved</p> <p>Charismatic megafauna with vital highly-specific parasites</p>	 <p>Reintroduction into alternative hosts OR Rediscovery after host extinction</p>
Parasite extinct	 <p>Current conservation paradigm</p> <p>Parasite a human health risk or otherwise unsuitable candidate</p>	 <p>Current paradigm when host conservation proves unsuccessful</p>

European weatherfish

European weatherfish (*Misgurnus fossilis*)

Decreased in large parts of its native range → endangered
(habitat loss, pollution, invasion of two Asian congeners)

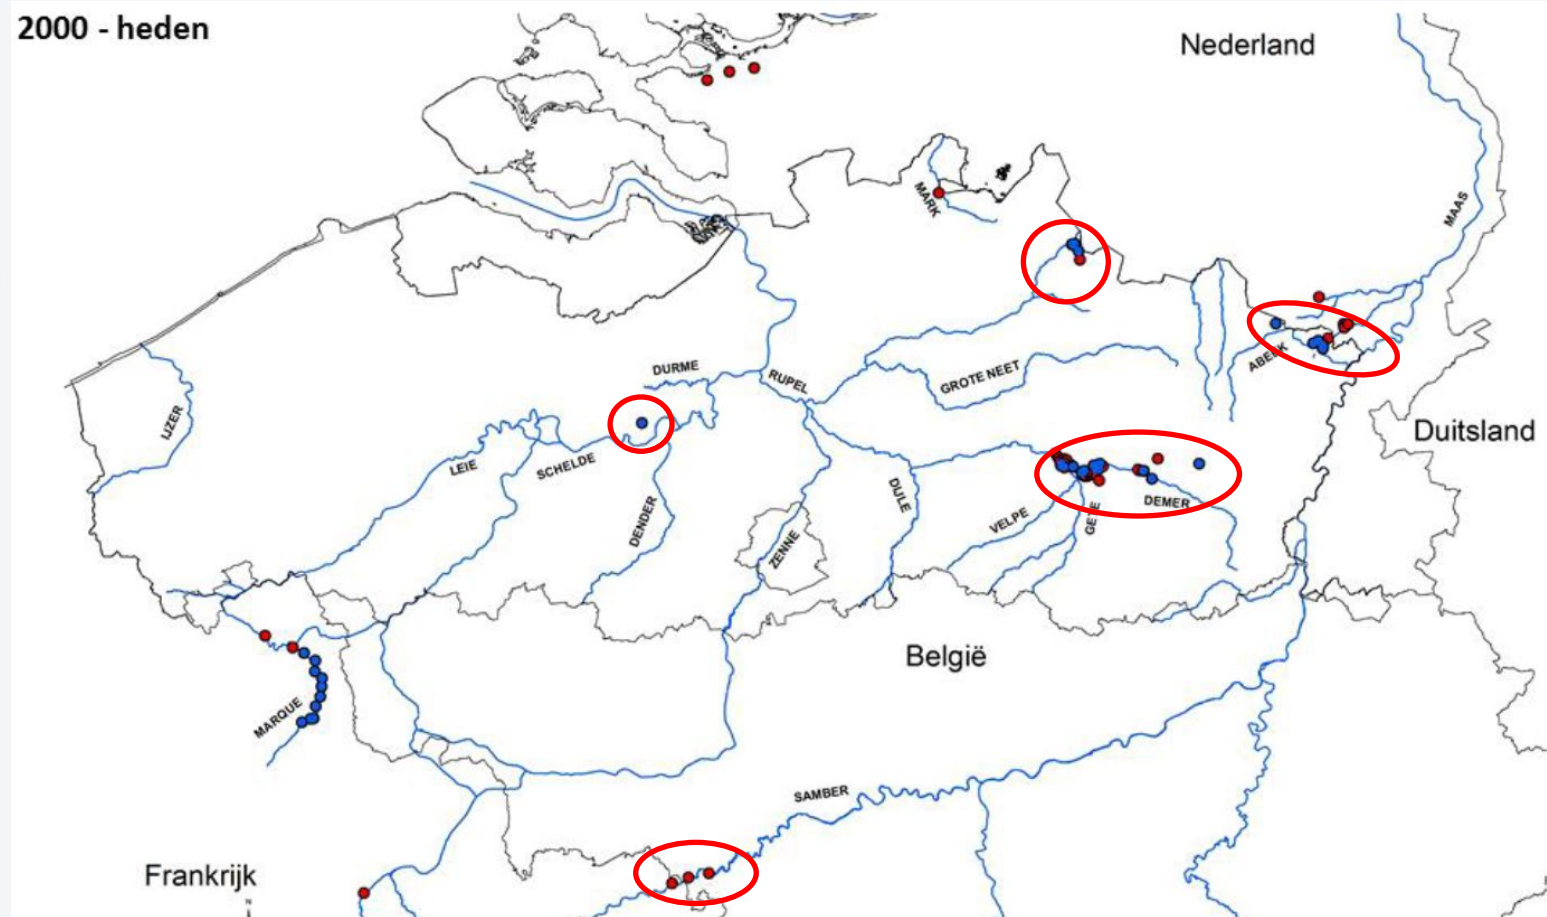

European weatherfish

Belgium: critically endangered (few small populations left)

**Critically
Endangered**

European weatherfish

Belgium: critically endangered (few small populations left)
Since 2021: protection plan in Flanders

Ex-situ breeding

- to restock existing Flemish populations
- to establish new ones in suitable habitats

INSTITUUT
NATUUR- EN
BOSONDERZOEK

Vlaanderen
is wetenschap

Parasites of the European weatherfish

What about their parasites?

18 fish from 2024 (9 adults + 9 juveniles)
9 fish from 1881-1973 (9 adults)

Parasites of the European weatherfish

Gyrodactylus misgurni
(Gyrodactylidea)

Native to Belgium

Actinocleidus cruciatus
(Dactylogyridea)

Gyrodactylus fossilis
(Gyrodactylidea)

Parasites of the European weatherfish

(unofficial) extinction risk in Czech Republic & Slovakia

HELMINTH CLASS/IUCN CATEGORY Helminth species	Host species	River basin ¹	Proposed IUCN category for Czech / Slovak Rep. ²

**Critically
Endangered**

Endangered

Winning pair

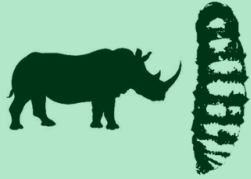

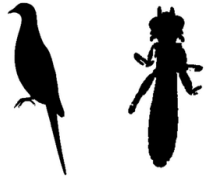

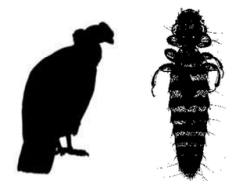

Normally, under moderate abundance, flatworms do not kill their hosts (instead: breeding populations)

→ not necessary to actively remove them during host conservation actions

Without parasite removal, conservation actions for hosts can benefit parasites, too!

→ Integrate parasitological assessments into conservation good practices

→ Collaborate with (host) conservation experts

	Host conserved	Host extinct
Parasite conserved	 <p>Ideal circumstances: both are saved Charismatic megafauna with vital highly-specific parasites</p>	 <p>Reintroduction into alternative hosts OR Rediscovery after host extinction</p>
Parasite extinct	 <p>Current conservation paradigm Parasite a human health risk or otherwise unsuitable candidate</p>	 <p>Current paradigm when host conservation proves unsuccessful</p>

Parasite perception

You protect what you like, and you like what you understand

→ Raise awareness on the importance of wildlife parasites

To better communicate with the public, we need to know

- what people **like** about wildlife parasites
→ **take advantage of this**
- what people **don't like** about wildlife parasites
→ **work to change this**

Parasite perception
